# Agenda

- Project overview
- Vision and goals
- State of Walkability in Indy
- Setting priorities
- Choosing projects
- Important destinations

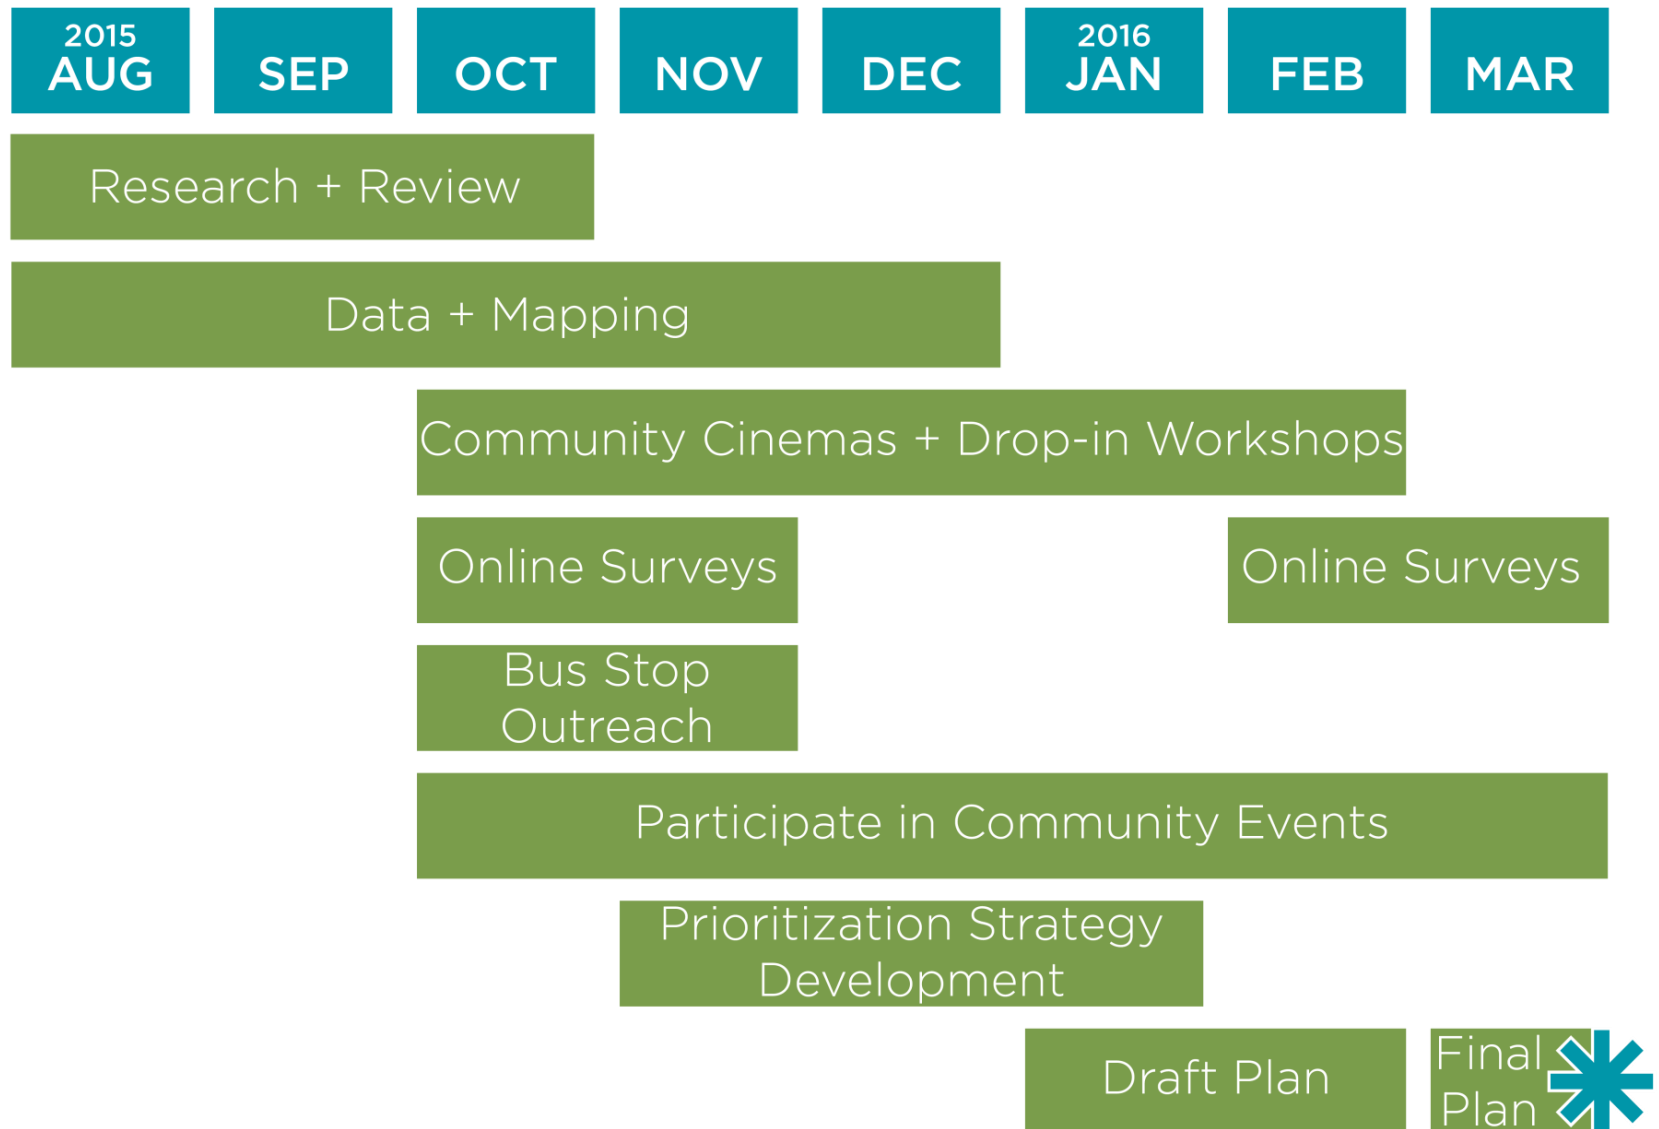

# Plan Purpose

---

- Create long-term vision for more walkable and healthy Indianapolis
- Establish clear, equitable, data-driven priorities for future investments
- Recognize resource constraints and make the most impact with available funding

# State of Walkability Report

## WHAT MAKES A CITY WALKABLE?

Almost everyone has a favorite place to walk. Though if you ask people what makes their favorite place so great, you're likely to get a range of answers. For some people, walkability means that there are shops and restaurants to visit. For others, it means that there are nice sidewalks and shade trees. Still others will tell you that it's all about getting from one place to another as efficiently as possible. The truth of the matter is that they're all valid!

**At its core, a walkable city is one where pedestrian transportation is convenient, safe, and enjoyable.** Walkable places are the result of partnerships between city departments, the private sector, and individual residents, all of whom have some role in creating great places for people to walk. Most of the policy-level impacts to walkability are controlled by the City of Indianapolis; think about these as the "levers" that the city can use to help make a place more walkable.

Six levers of walkability in Indianapolis are described below and can be used to assess a neighborhood's ability to support walking. Although applying these levers in an area won't automatically create a walkable community, a place that is missing many of these elements is unlikely to support much walking. Until these levers are embraced, walking won't be seen as a routine and expected part of life across Indianapolis.

Each lever is important and works in concert with the others to shape walkability. Just because one of these elements is missing in a neighborhood doesn't automatically mean the area is unwalkable. Rather, Indianapolis' streets, cultural districts, and neighborhoods lie along a spectrum of walkability. As the levers are adjusted, these places move along the spectrum, hopefully toward becoming more walkable.

**Lever #1: Pedestrian-oriented design.** Streets in a walkable community need to be designed first and foremost for people who are walking, both along streets (sidewalks and paths) and across it (at intersections or at midblock locations). Many streets in Indianapolis accommodate people walking at the most basic level—for example, they may have a sidewalk—but they are not designed for comfort and are not likely to encourage walking for transportation or recreation. Streets should not treat people

walking as an afterthought; rather, they must be designed for people of all ages and abilities. For those that walk or roll using a mobility device, a street should offer a well maintained sidewalk of comfortable width, high visibility marked crossings with walk-friendly signal timing, refuge islands

at major crossings, street trees and other buffers from traffic, lighting, and features that make walking pleasant. Shelby Street in Fountain Square and many streets in downtown Indianapolis provide these features.

While sidewalks and intersections should not be designed the same, Figure 1 demonstrates the sidewalk zones that should be considered when designing a sidewalk corridor and Figure 2 illustrates key design elements of safe and comfortable intersections. These are the types of improvements and designs that make people feel safe and comfortable while walking.

# State of Walkability Report

## EXISTING INFRASTRUCTURE

Indianapolis residents need walking infrastructure that feels safe and comfortable in order to encourage walking. Walking infrastructure needs to make people feel respected and cared for—without supportive infrastructure, people may choose not to walk or take transit.

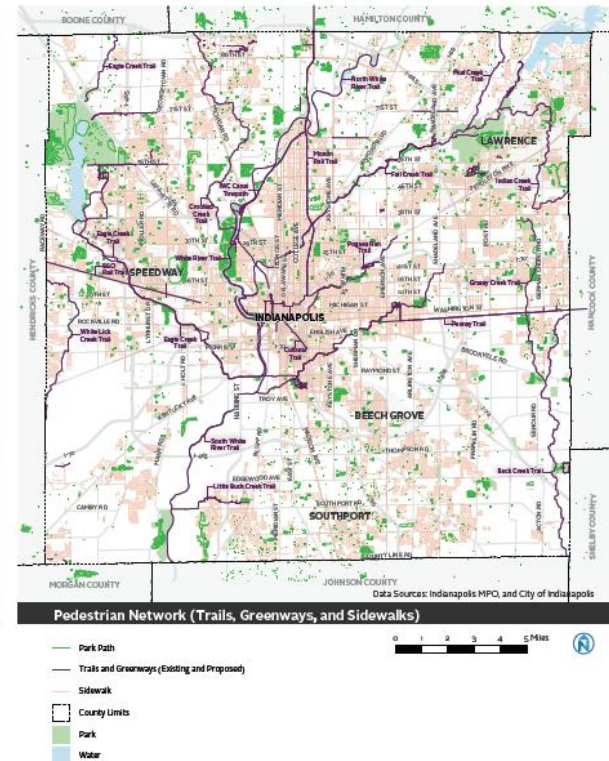

The following maps show the transportation network available for people walking in Indianapolis, establishing a baseline understanding of where infrastructure exists and where it is missing. In some neighborhoods, Indianapolis has an extensive sidewalk and trail network. Center Township and the older stock of inner ring neighborhoods have access to the greatest density of pedestrian infrastructure. Importantly, large sections northwest and southeast of downtown lack sidewalks or accessible curb ramps.

## TRANSIT AND ROADWAY NETWORK

Indianapolis has an extensive street and transit network, but accessing these networks on foot can be challenging. The design, speeds, and volumes of Indy's major thoroughfares are major barriers for people walking along and across the street. Expressways also interrupt the pedestrian network in areas without underpasses or overpasses. The transit system—which spreads throughout much of Marion County—can help connect people to destinations that are too far away to reach on foot, but there are neighborhoods in the southeast and southwest of Indianapolis that lack transit services. Future rapid transit lines will radiate from Center Township, providing high quality, frequent transit service as well as enhanced pedestrian connections to transit stops and stations.

## THE PEDESTRIAN NETWORK

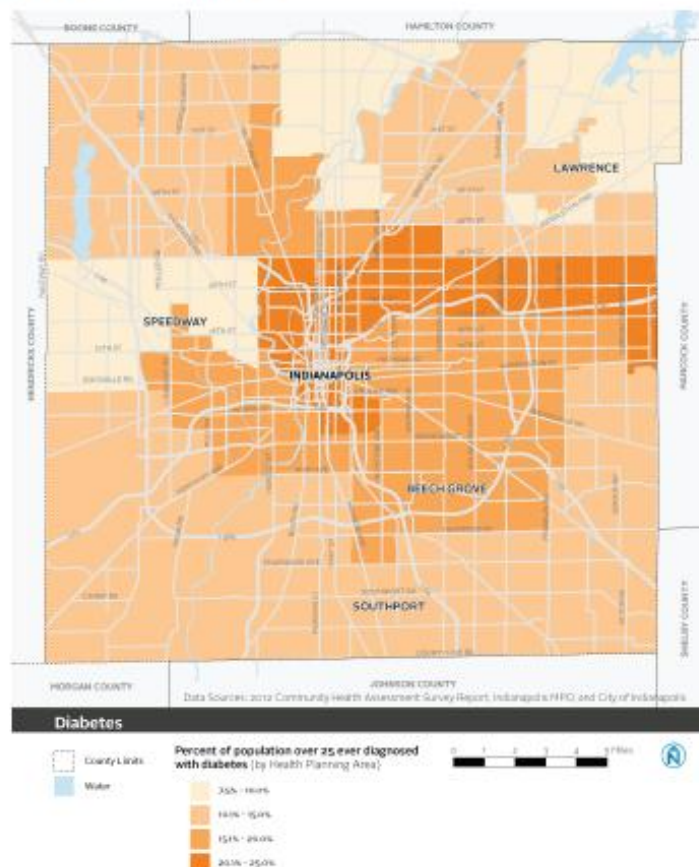

Indianapolis is home to a world-class trail and greenway network, including the Indianapolis Cultural Trail and the Monon Trail. Complementing the trail and greenway system is a network of linear pedestrian facilities including sidewalks, pedestrian bridges, and underpasses. Park paths also serve as neighborhood connectors and links between regional trail segments such as Eagle Creek Trail at Eagle Creek Park. The countywide system of 233 miles of trails and greenways weave together Indy's neighborhoods, offering an alternative, stress-free connection between neighborhoods and major destinations while encouraging active recreation. At the same time, the trail network is still not widespread enough to provide all of the walking infrastructure that's needed in neighborhoods that lack sidewalks.

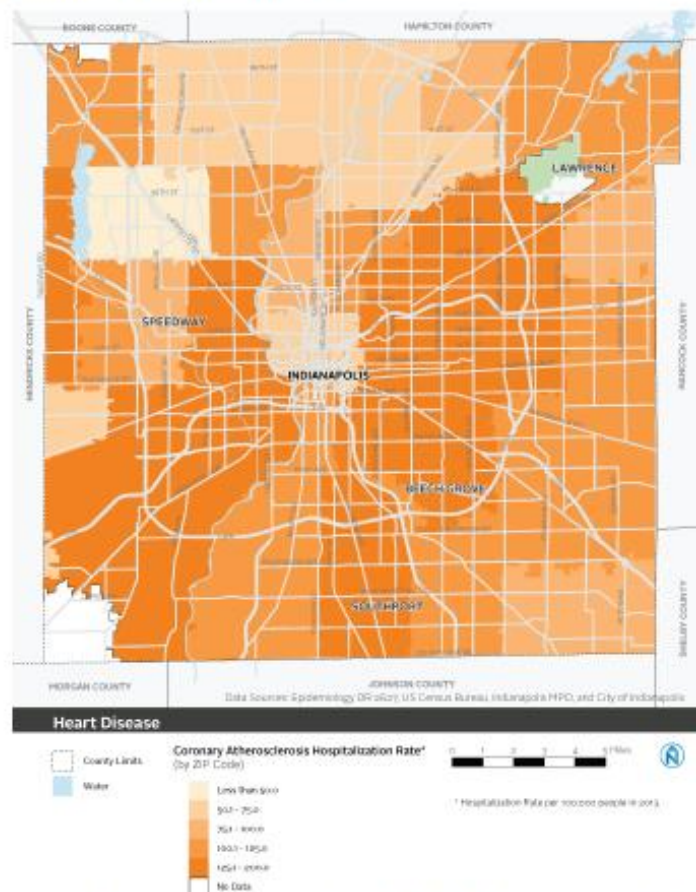

# State of Walkability Report

## RATE OF DIABETES

The incidence of Type 2 Diabetes is exacerbated by poor nutrition, inactivity, and being overweight. Therefore, like obesity, diabetes is an indicator of sedentary lifestyles, which correlate directly with community design and walkability. The highest concentrations of Indianapolis residents who have been diagnosed with diabetes are located in areas surrounding downtown Indianapolis and east along 30th Street to the Hancock County border. These areas correspond with neighborhoods that have limited sidewalk coverage and low walking comfort.

## RATE OF HEART DISEASE

Coronary atherosclerosis, or heart disease, is the condition in which heart arteries slowly become clogged and hardened, usually from the buildup of fat, cholesterol, calcium, and other substances. This causes heart attacks, strokes, and other heart-related conditions. Atherosclerosis can worsen as a result of stress, smoking, unhealthy diets, lack of exercise, having diabetes, and being overweight/obese. Many of those factors can be improved by walking. The highest hospitalization rates in Indianapolis for atherosclerosis are in the neighborhoods immediately east and west of Center Township. The lowest rates are in the suburban neighborhoods north of Speedway.

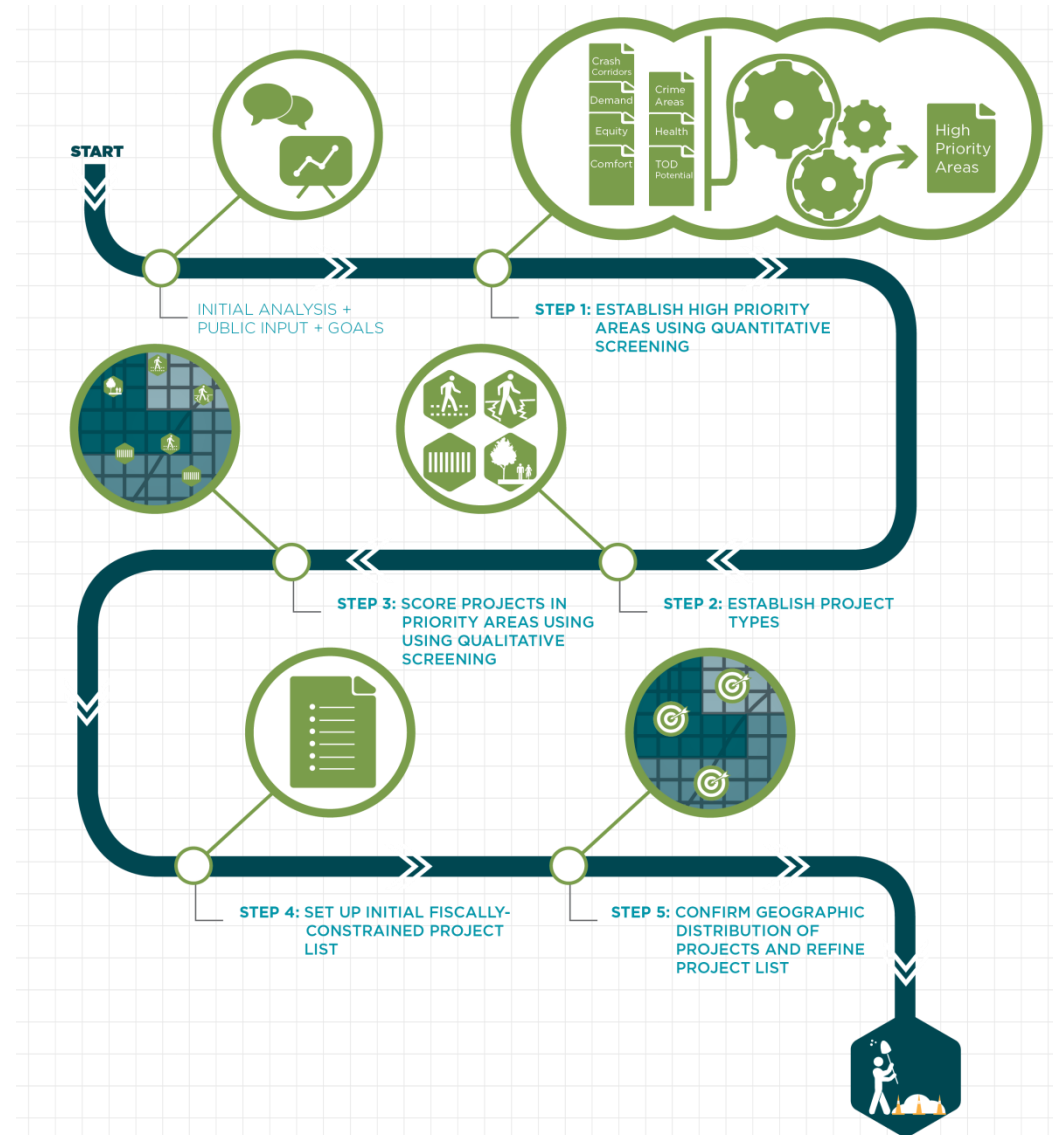

# Setting Priorities

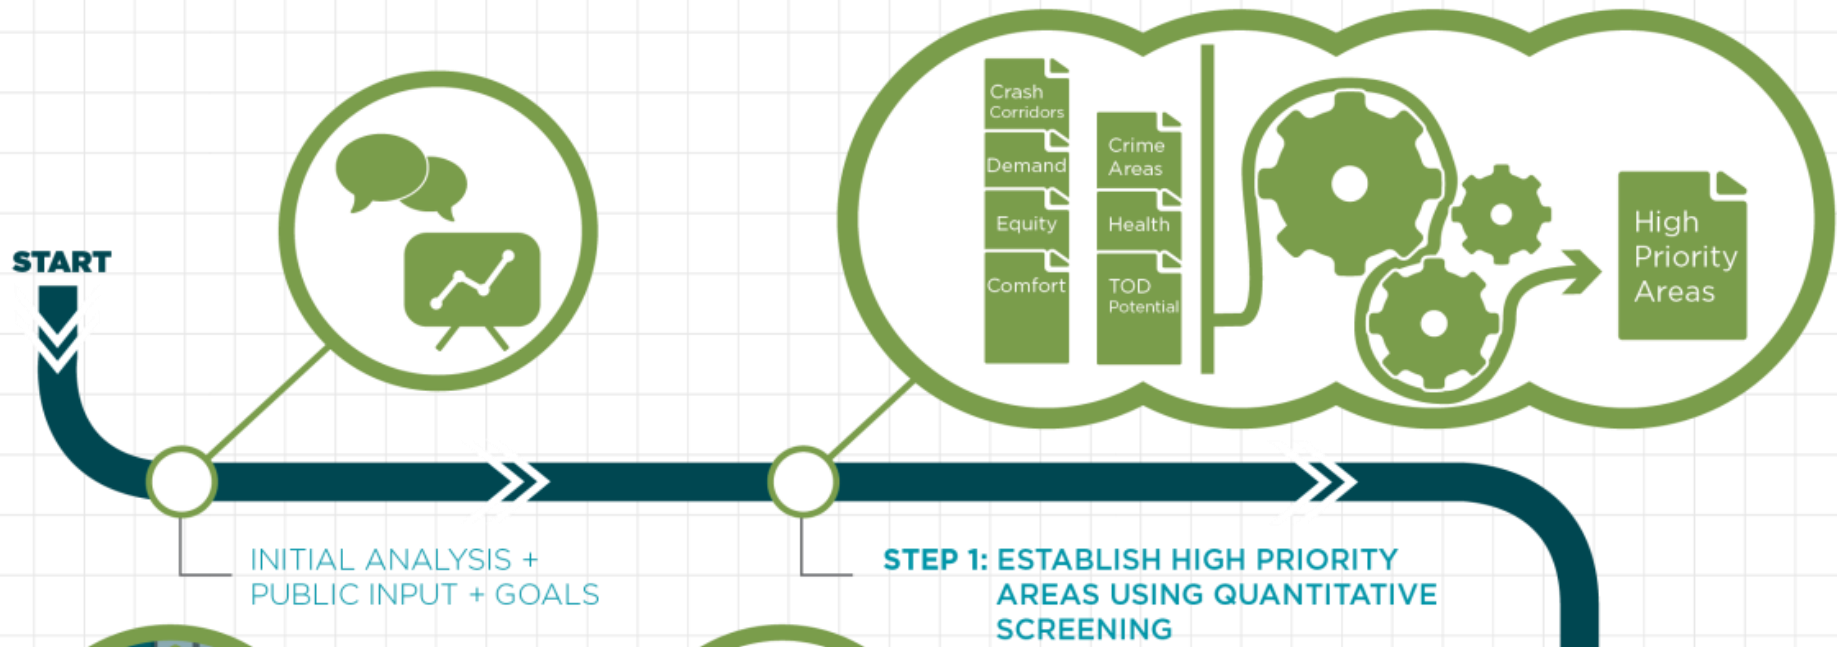

# Setting Priorities

- Achieve project goals
- Select priority areas
- Score projects
- Maintain city flexibility
- Ensure priority projects reflect mix of land use types
